What is machine learning and WHEN TO USE IT
As an FDE, ML Engineer…..

ML should be your last choice!

First the choice should be rules!

Create a deterministic system:
1. Rule no.1
2. Rule no.2
3. Rule no.3
4. ……..

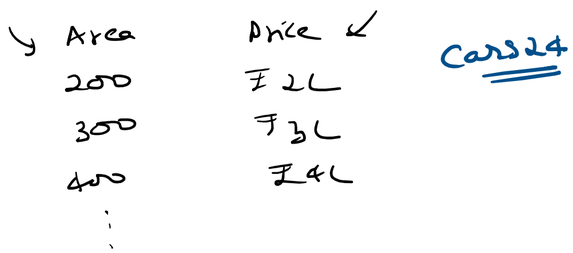

Only if the rule base it too large to create, then only go towards ML.
Using ML, computers figure out the rules on its own.

FDE, Paramount Cables.
That every month they need to allocate orders on machines.

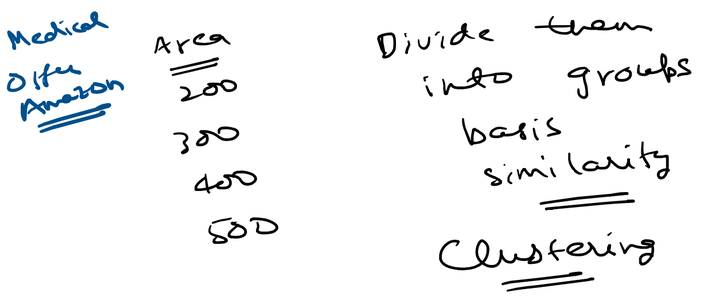

Every machine a specific capacity based on type of wire being produced.
Machines are also different for different materials
Client priority.

Rule Based System.

ML -> 4 categories
1. Supervised -> You know what to predict, there is input + output

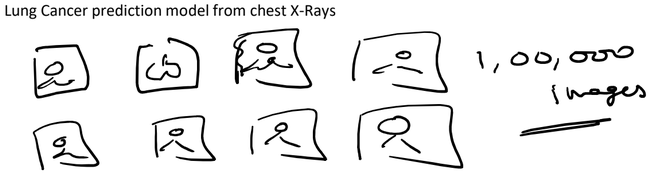

2. Unsupervised -> Where only input is available, nothing to predict

3. Semi Supervised

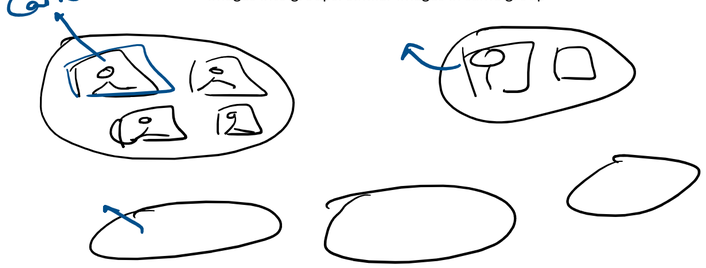

Lung Cancer prediction model from chest X-Rays

1. Unsupervised learning

Cancer

Images into groups. Similar images in same group

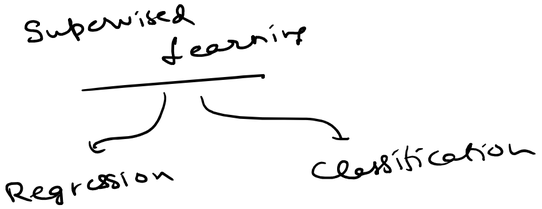

4. Reinforcement Learning

Model can prepare its dataset also on its own and train itself.

Chess -> Humans learnt chess
Old patterns, 1980, move -> then this happened. Playing more games.

Two machines -> Playing against each other.

|---|---|
| Predicting continuous values<br>Eg. House price.<br>Temperature<br><br>Predict a number | Predicting fixed categories only.<br>Eg. Pass/Fail<br>Ratings given to uber driver |

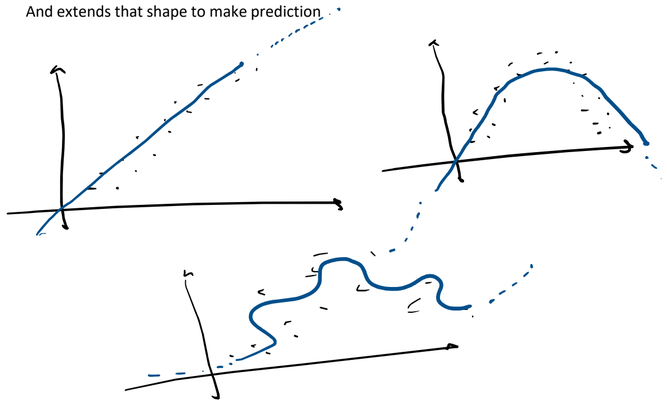

Which do you think happened first, Regression or Classification

Regression came into the world
Classification is actually -> Regression + A cutoff

Rough idea of Linear Regression, it tries to fit a shape to your data
And extends that shape to make prediction

ML Pipeline:
1. Training -> We feed data into the model and it is trained to identify patterns
2. Inference -> Use the trained model for inference purposes.
